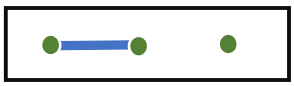
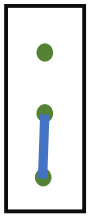
Artix 7 Diary:

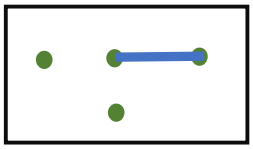
5/13/2022: With USB connector from computer to board, or converter from wall to board, JP1, JP2 and JP3 set in the following positions, the Artix 7 board comes alive, looking at the board with labels in normal reading position. Done light is on, RGB LEDs come on, BCD display cycles, and input switches turn on green LEDs when pushed up.

1) JP1 is across pins QSPI and JTAP, 2 pins to far left



2) JP2 is across USB pair, bottom





3) JP3 is across wall power position: upper right of upside down triangle of pins
